Abstract: Today we live in a modern society. Everything in this society is based on digital technology. At the same time, libraries are moving to electronic and smart systems. This article also talks about smart libraries based on new technologies.

Keywords: Smart library, spirituality, family attitudes, fields of science, library.

Introduction: Just as the body can never be a whole without soul and spirit, economic development cannot be achieved without spirituality and education. Only a nation with an independent deep thought and high belief in the past can develop its ideas on the path of goodness and development together. No foreign idea can seduce a nation that has risen with its spiritual unity. In our country, large-scale reforms are being carried out to increase the welfare of the people, develop the economy, build a new Uzbekistan with new principles.

In particular, the Resolution of the President of the Republic of Uzbekistan No. PP-4307 "On additional measures to increase the effectiveness of spiritual and educational work" and the radical improvement of the system of spiritual and educational work under the chairmanship of President ShavkatMiromonovichMirziyoyev on January 19, 2021. This is evidenced by the views expressed at the video conference on strengthening cooperation between government and public organizations.

Main part: It reads: "... as we decide to build a new Uzbekistan, we will rely on two solid pillars. The first is a strong economy based on market principles. The second is the rich heritage of our ancestors and a strong spirituality based on national values." Indeed, one cannot strive for the future without knowing the past, understanding one's self and respecting it. To do this, we must first change family attitudes. Today, unfortunately, some parents say, "My child was brought up in the West, he thinks in the West." In fact, we should be proud of our children, who are not Western-minded, but have the experience of developed countries that are in line with our national values, who can implement their development, who put national interests first, who have secular knowledge.

In his address to the OliyMajlis on December 30, 2020, President Islam Karimov said, "We have set ourselves the great goal of building the foundations of the Third Renaissance in our country. At the same time, first of all, the development of education and upbringing, healthy lifestyle decisions, the development of science and innovation should serve as the main pillars of our national idea. To achieve this goal, our young people must set great goals, create many opportunities for them to achieve them and provide them with all possible support - the highest priority for all of us. Only then will our children become a great and powerful force that will realize the age-old dreams of our people."

We all know that innovative technologies are developing rapidly in the world. The inventions, models and innovations created today serve the people worthily. Innovation and startups inspire young people to be courageous, to create innovations, to work on various projects that will benefit people and benefit the country. I believe that it is a modern requirement for each young generation to study the system of processes abroad and work on innovations that will leave their ideas behind, in return for the conditions created by our President for young people.

The IT-park established in our region and the incubation centers established at the Karshi Institute of Engineering and Economics will make a worthy contribution to the development and digitization of all sectors of the economy, as well as our region.

This requires the creation of innovations in the fields of science, education,

spirituality and enlightenment, as well as in other areas. After all, nothing can bend the height of a nation that is spiritual and strong in faith. To this end, I would like to propose the project "Smart Library" to fill the minds of people with spiritual nourishment, to spend their busy time meaningfully.

Because literature should be available everywhere. At any given moment, our phones have access to almost all of the world's knowledge, literature, history, and science. Despite such riches, most of us prefer to spend time watching social media, messaging, or casual videos. The innovative "SMART LIBRARY" I want to create is a way to make the most of the time spent waiting for short stories or small breaks in our work, and to develop a way to make the most of all our free time during the day. I aim to widely promote the scientific and creative heritage of our great scientists, especially among our youth. As part of our literacy and advocacy programs, we offer free cultural recreation through the installation of SMART LIBRARIES at bus stops, schools, community centers, shops, around waiting lists, and airport hospitals throughout the city. Reducing people's day-to-day fatigue and mental strain further develops our spirituality through a new innovative way of engaging them in literature and the arts. Through this project, all roads lead us to the library. The short edition not only raises our literary consciousness, but also encourages the spirit of literary creation to spread throughout the city, to instill in our hearts a feeling of love and pride for our great ancestors and the motherland.

Conclusion: All you have to do is select the life and work of the writer you want, or his masterpieces, the poems of your favorite poet, and press the button on the touch screen, in a few seconds the masterpieces you want and are interested in will be printed on a check. Anyone who has read the story will begin to capture a wider audience of our literature by giving it to friends or family members. We can widely promote the heritage of our ancestors in remote areas, villages, even in areas where the Internet system does not work well or does not exist at all, using modern "Smart Library" equipment. The device publishes each story to the reader at any time of the day and requires the user to call the hotline with a warning light when the paper wrapping or color runs out. The paper wraps and color are easy to change. Each paper can print 350 to 450 stories. Mobility is ensured due to its compact size and light weight. The Smart Library does not require a maintenance staff and is easy to manage independently. The database will be expanded by constantly updating the software in it.
