#### Abstract

The main purpose of this paper is to find the general form of the rational valued characters table $\stackrel{*}{\equiv}\left(Q_{2 m} \times C_{3}\right)$ When $m=3^{h} \cdot p_{1}^{r_{1}} \cdot p_{2}^{r_{2}} \ldots \ldots p_{n}^{r_{n}}, h, r \in Z^{+}$and $p$ is prime Number where $Q_{2 m}$ is the Quaternion group of order $4 m$ and $C_{3}$ is the Cyclic group of order3 this table depends on Artin's characters table of a quaternion group of order $4 m$ when $m=$ $3^{h} \cdot \boldsymbol{p}_{1}^{r_{1}} \cdot \boldsymbol{p}_{2}^{r_{2}} \ldots \ldots \boldsymbol{p}_{n}^{r_{n}}$. which is denoted by $\stackrel{*}{\equiv}\left(Q_{2 m} \times C_{3}\right)$.

Keywords- Group; Quaternion group; Rational; Rational's characters table.

## INTRODUCTION

Let $G$ be a finite group, two elements of $G$ are said to be $\Gamma$-conjugate if the cyclic subgroups they generate are conjugate in G. This process defines an equivalence relation on G ; its classes are called $\Gamma$-classes.
Let $\equiv^{*}(G)$ denotes the $r \times r$ matrix which the rows corresponds to the $\theta_{i}$ 's and the columns correspond to the $\Gamma$-classes of $G$. The matrix expressing $\overline{\boldsymbol{R}}(\boldsymbol{G})$ basis in terms of the $c f(G, Z)$ basis is $\equiv^{*}(G)$.In 1959, M.J. Hall[6] is found" The rational valued characters table of finite group" In 1981 C.W. Curits and I. Reiner[2] studied Methods of Representation Theory with Application to Finite Groups. The aim of this paper is to find the general from of The rational valued characters table $\stackrel{*}{\equiv}\left(\mathrm{Q}_{2 \mathrm{~m}} \times \mathrm{C}_{3}\right)$ when m is an odd number and finding the cyclic decomposition of Artin cokernel $\mathrm{AC}\left(\mathrm{Q}_{2 \mathrm{~m}} \times \mathrm{C}_{3}\right)$ when m is an odd number

## 1 Preliminaries

In this section studied some important definitions and basic concepts of a rational valued characters and a rational valued characters table.

Definition (2.1):[3]A rational valued character $\theta$ of $G$ is a character whose values are in $Z$, which is $\theta(g) \in Z$, for all $g \in G$.

are the irreducible characters of $G$ and their numbers are equal to the number of conjugacy classes of cyclic subgroup of $G$

Theorem (2.3):[1] Let $\mathrm{T}_{1}: \mathrm{G}_{1} \rightarrow \mathrm{GL}(n, \mathrm{~F})$ and $\mathrm{T}_{2}: \mathrm{G}_{2} \rightarrow \mathrm{GL}(m, \mathrm{~F})$ be two irreducible representations of the groups $\mathrm{G}_{1}$ and $\mathrm{G}_{2}$ with characters $\chi_{1}$ and $\chi_{2}$ respectively then: $T_{1} \otimes T_{2}$ is irreducible representation of the group $G_{1} \times G_{2}$ with the character $\chi_{1} \cdot \chi_{2}$.

Proposition (2.4):[2]The number of all rational valued characters of a finite group $G$ is equal to the number of all distinct $\Gamma$ classes on G.

Definition (2.5): [4] The complete information about rational valued characters of a finite group G is displayed in a table called rational valued characters table of $\mathbf{G}$. We refer to it by $\stackrel{*}{\equiv}(\mathrm{G})$ which is $\mathrm{n} \times \mathrm{n}$ matrix whose columns are $\Gamma$-classes and rows which are the values of all rational valued characters of $G$, where n is the number of $\Gamma$-classes.

Proposition (2.6):[5]The rational valued characters table of cyclic group $C_{p^{s}}$ of rank s+1 where p is prime number which is denoted by $\left(\stackrel{*}{\equiv}\left(\mathrm{C}_{p^{s}}\right)\right)$, is given by:

Where $0 \leq \mathrm{r} \leq \mathrm{m}-1$, I is the number of $\Gamma$-classes of $\mathrm{C}_{2 \mathrm{~m}}, \theta_{\mathrm{j}}$ such that $1 \leq \mathrm{j} \leq \mathrm{I}+1$ are the rational valued characters of the group $\mathrm{Q}_{2 \mathrm{~m}}$ and if we denoted $\mathrm{C}_{\mathrm{ij}}$ the elements of $\stackrel{*}{\equiv}\left(\mathrm{C}_{\mathrm{m}}\right)$ and $\mathrm{h}_{\mathrm{ij}}$ the elements of H as defined by:

$$
h_{i j}=\left\{\begin{array}{lll}
C_{i j} & \text { if } & i=1 \\
C_{i j} & \text { if } & i \neq 1
\end{array}\right.
$$

And where I is the number of $\Gamma$-classes of $\mathrm{C}_{2 \mathrm{~m}}$.

## 2 THE MAIN RESULTS

In this section we find the rational valued character table of the group $\left(\mathrm{Q}_{2 \mathrm{~m}} \mathrm{XC}_{3}\right)$ and $\mathrm{AC}\left(\mathrm{Q}_{2 \mathrm{~m}} \mathrm{XC}_{3}\right)$ when m is an odd number.

Proposition(3.1):The rational valued characters table of the group $\left(\mathrm{Q}_{2 \mathrm{~m}} \times \mathrm{C}_{3}\right)$ when m is $3^{h} \cdot \boldsymbol{p}_{1}^{r_{1}} \cdot \boldsymbol{p}_{2}^{r_{2}} \ldots \ldots \boldsymbol{p}_{n}^{r_{n}}$ is given as follows:
$\stackrel{*}{\equiv}\left(Q_{2 m} \times C_{3}\right)=\stackrel{*}{\equiv}\left(Q_{2 m}\right) \otimes \stackrel{*}{\equiv}\left(C_{3}\right)$.
Proof:-
Since
TABLE3
CHARACTERS TABLE OF THE GROUP C 3

|  | $h_{1}^{\prime}$ | $h_{2}^{\prime}$ |
| :--- | :--- | :--- |
| $\chi_{1}^{\prime}$ | $\mathbf{3 - 1}$ | $\mathbf{- 1}$ |
| $\chi_{2}^{\prime}$ | $\mathbf{1}$ | $\mathbf{1}$ |

TABLE4
RATIONALCHARACTERS TABLE OF GROUP C $\mathrm{C}_{\mathrm{p}}$

$$
\stackrel{*}{\equiv}\left(C_{3}\right)=
$$

|  | $h_{1}^{\prime}$ | $h_{2}^{\prime}$ |
| :--- | :--- | :--- |
| $\theta_{1}^{\prime}$ | $\mathbf{3 - 1}$ | $\mathbf{- 1}$ |
| $\theta_{2}^{\prime}$ | $\mathbf{1}$ | $\mathbf{1}$ |

Then,
$\chi_{1}^{\prime}\left(h_{1}^{\prime}\right)=\theta_{1}^{\prime}\left(h_{1}^{\prime}\right)=3-1$
$\chi_{1}^{\prime}\left(h_{2}^{\prime}\right)=\theta_{1}^{\prime}\left(h_{2}^{\prime}\right)=-1$
$\chi_{2}^{\prime}\left(h_{1}^{\prime}\right)=\chi_{2}^{\prime}\left(h_{2}^{\prime}\right)=\theta_{2}^{\prime}\left(h_{1}^{\prime}\right)=\theta_{2}^{\prime}\left(h_{2}^{\prime}\right)=1$
From the definition of $\mathrm{Q}_{2 \mathrm{~m}} \times \mathrm{C}_{3}$,
and Theorem(2.3) we have
$\equiv\left(\mathrm{Q}_{2 \mathrm{~m}} \times \mathrm{C}_{\mathrm{p}}\right)=\left(\equiv \mathrm{Q}_{2 \mathrm{~m}}\right) \otimes\left(\equiv \mathrm{C}_{3}\right)$
Each element inQ ${ }_{2 m} \times \mathrm{C}_{3}$
$h_{n g}=h_{n} \cdot h_{g}^{\prime} \forall h_{n} \in \mathrm{Q}_{2 \mathrm{~m}}, h_{g}^{\prime} \in \mathrm{C}_{3}$,
$n=1,2,3, \ldots, 4 \mathrm{~m}, \mathrm{~g}=1,2$
And each irreducible character of $\mathrm{Q}_{2 \mathrm{~m}} \times \mathrm{C}_{3}$ is
$\chi_{(i, j)=} \chi_{i} \cdot \chi_{j}^{\prime}$
where $\chi_{i}$ is an irreducible character of $\mathrm{Q}_{2 \mathrm{~m}}$ and $\chi_{j}^{\prime}$ is the irreducible character of $\mathrm{C}_{3}$, then

$$
\chi_{(i, j)}\left(h_{n g}\right)=\left\{\begin{array}{l}
(3-1) \chi_{i}\left(h_{n}\right) \quad \text { if } j=1 \text { and } g=1 \\
-\chi_{i}\left(h_{n}\right) \quad \text { if } j=1 \text { and } g=2 \\
\chi_{i}\left(h_{n}\right) \quad \text { if } j=2 \text { and } g=2
\end{array}\right.
$$

From Corollary (2.2)

$$
\theta_{(i, j)}=\sum_{\sigma \in \operatorname{Gal}\left(Q\left(\chi_{(i, j)}\right) / Q\right)} \sigma\left(\chi_{(i, j)}\right)
$$

where $\theta_{(i, j)}$ is the rational valued character of $\mathrm{Q}_{2 \mathrm{~m}} \times \mathrm{C}_{3}$
Then,

$$
\theta_{(i, j)}\left(h_{n g}\right)=\sum_{\sigma \in \operatorname{Gal}\left(Q\left(\chi_{(i, j)}\left(h_{n g}\right)\right) / Q\right)} \sigma\left(\chi_{(i, j)}\left(h_{n g}\right)\right)
$$

(I) (a) If $\mathrm{j}=1$ and $\mathrm{g}=1$

$$
\begin{aligned}
& \theta_{(i, j)}\left(h_{n g}\right)=\sum_{\sigma \in \operatorname{Gal}\left(Q\left(\chi_{\left.i\left(h_{n}\right)\right)}\right) / Q\right)} \sigma\left(\chi_{i}\left(h_{n}\right)\right)=\theta_{i}\left(h_{n}\right) \cdot(3-1)= \\
& =\theta_{i}\left(h_{n}\right) \cdot \theta_{j}^{\prime}\left(h_{g}^{\prime}\right)
\end{aligned}
$$

(b) If $j=1$ and $g=2$

$$
\begin{aligned}
& \theta_{(i, j)}\left(h_{n g}\right)=\sum_{\left.\sigma \in \operatorname{Gal}\left(Q\left(\chi_{i\left(t_{n}\right)}\right)\right) / Q\right)} \sigma\left(-\chi_{i}\left(h_{n}\right)\right)=-\sum_{\left.\sigma \in \operatorname{Gal}\left(Q\left(\chi_{i\left(h_{n}\right)}\right)\right) / Q\right)} \sigma\left(\chi_{i}\left(h_{n}\right)\right)=\sum_{\sigma \in \operatorname{Gal}\left(Q\left(\chi_{i\left(h_{n}\right)}\right) / Q\right)} \sigma\left(\chi_{i}\left(h_{n}\right)\right) \cdot-1=\theta_{i}\left(h_{n}\right) \cdot-1=\theta_{i}\left(h_{n}\right) \cdot \theta_{j}^{\prime}( \\
& \left.h_{g}^{\prime}\right)
\end{aligned}
$$

(II) if $\mathrm{j}=2$ and $\mathrm{g}=2$
where $\theta_{i}$ is the rational valued character of $\mathrm{Q}_{2 \mathrm{~m}}$.
From [I] and [II] we have
$\theta_{(i, j)}=\theta_{i} . \theta_{j}^{\prime}$.
Then $\equiv^{*}\left(\mathrm{Q}_{2 \mathrm{~m}} \times \mathrm{C}_{3}\right)=\equiv^{*}\left(\mathrm{Q}_{2 \mathrm{~m}}\right) \otimes \equiv^{*}\left(\mathrm{C}_{3}\right)$.
